

**ABSTRACT**

The present invention relates to a commodity package, comprising a hanging member that has a hole for hanging, and a holding body for holding an article. The holding body has a first cutting portion for separating a first recess and the upper part of a first brim portion from each other, and a second cutting portion for separating a second recess and the upper part of a second brim portion from each other. The hanging member has a third cutting portion for separating the upper part and the lower part thereof from each other. The first, second and third cutting portions are provided at different heights.

This makes it possible for the commodity package, when hung, to maintain favorable balance and obtain sufficient intensity.
